

MARBLE WAIVER

Marble surfaces are more susceptible to staining by common liquids such as mustard, oil vinegar, citric juice, toothpaste, mouthwash, hairspray, etc. Any acidic substance that may come in contact with your marble countertop will cause a chemical reaction that will etch and remove the polish of the marble.

- Marble is a natural product that is more porous than granite and therefore, more susceptible to staining and chipping.
- Marble is a soft material which can easily be scratched.
- Marble comes with surface scratches and fissures (a form of crack that has no stone content and is usually filled with clear resin).
- Marble has extrusions (small visual cracks that are not defects in the marble itself).
- Marble can come with shade, veining, and pattern variances from one end of the slab to the other.
- Marble will wear and lose its shine over time.
- Marble is strongly not recommended for kitchen countertops.
